## QuantifiCare launches a 3D Skin Analysis application for Facial Specialists

Once again, the global imaging company enhances the doctor/patient experience with its latest addition – the SkinCare module. Practitioners can measure/analyze topical facial skin conditions and generate a full skin report, all in 3D. QuantifiCare pushes the limits on skin analysis to allow the 3D LifeViz II™ camera to become an “all-in-one” solution for Aesthetic Doctors, Dermatologists and Plastic Surgeons.

Up to now, with QuantifiCare’s Software Suite, practitioners were able to display superior quality, to view 3D patient pictures from a multitude of angles, to highlight treatment options with personalized 3D simulations and to compare with previous visits.

The new SkinCare module enables physicians to generate a complete report measuring skin changes including wrinkles, oiliness, pores, evenness, red & brown spots and compare their skin health against a matching population. The severity of each criterion can be visualized in 3D and highlighted with a colour scale. The report provides a reference tool to guide the physician and inform the patient of the best aesthetic interventions.

With the new addition, the 3D LifeViz II™ is bound to become an intrinsic part of facial specialist practices, offering an “all-in-one” solution, which is easy to use, portable and at a competitive price.
