NON-ABLATIVE SKIN TIGHTENING FOR ALL SKIN

TYPES

plasmatek
WIRELESS

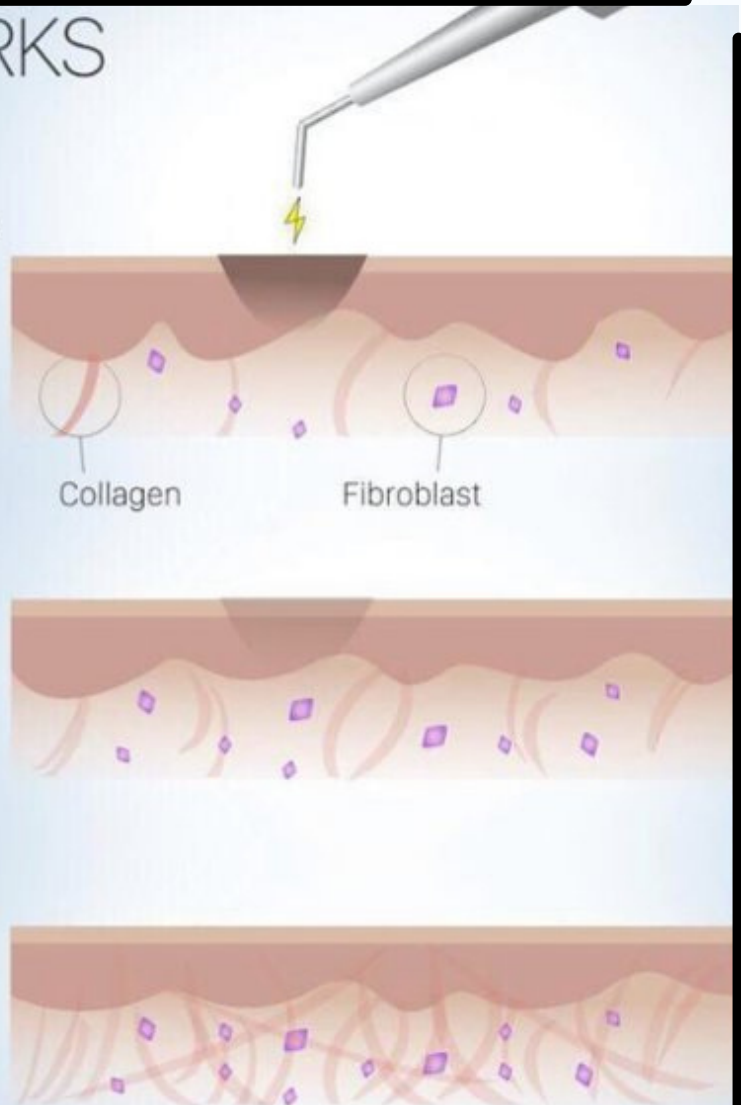

HOW DOES PLASMA AFFECT THE SKIN?

HOW IT WORKS

1. A plasma flash (small electrical charge) creates controlled, light damage to the epidermis (upper layer of the skin).

2. This stimulates fibroblast cells to produce more collagen to repair the skin.

3. Collagen continues to generate for 4-6 weeks after treatment resulting in lifted, younger, smoother skin.

NON-ABLATIVE PROBE APPLICATIONS:

- The Plasmatek Wireless comes with two reusable probes which are ideal for skin tightening and make use of Electromagnetic Current emitted by the device.
- Electromagnetic current is colour blind and can be used successfully on ALL skin types with no skin preparation required.
- These probes can be used with ZERO risk of PIH & ZERO down time.
- This treatment has immediate results and can be done even 30 minutes before a client's function or event.
- Treatments take 10 minutes and can be done as frequently as twice per week.

INTRADERMAL RF ELECTROCANULA

- The latest addition to the Plasmatek Wireless is an Intradermal Radio Frequency Electrocanula for fat ablation
- This can be used for fatty pockets under the eyes as well as larger areas all throughout the body ie Saddle bags
- This procedure is strictly for Doctors only and requires a local block in the area being treated.
- Once the fatty tissue has been ablated, the ablative tip can then be used on the area to tighten the skin.
- Please see below for before and after images for this treatment, followed by before and after images using the ablative tip on the page that follows:
